

AI Organizer

User Manual · Save, organize, and sync AI chats from ChatGPT, Claude, Gemini, Grok, DeepSeek & Perplexity

☁ Sync and Restore

Sync saves your data (saved chats, prompts, folders/workspaces, theme) to your account in the cloud. Use it before switching devices or reinstalling the extension.

Restore loads the data stored on your account and merges it with your current local data (by URL for chats, by ID for prompts and folders—no duplicates). Use it on a new device or after reinstall.

Both buttons are in the extension **footer** (☁ Sync and ↺ Restore). You must be **signed in** with your license and account. After first login, the extension can optionally restore your data automatically.

Getting started

Sign in with your **license key**, **email/username**, and **password**. The first time you use the extension, a short onboarding explains saving and organizing. Use the **Dashboard** link in the header (or Menu) for settings and stats.

Saving chats

- On any supported AI chat page: use the **floating Save button** or press `Ctrl+Shift+S` (Windows/Linux) / `Cmd+Shift+S` (Mac).
- Right-click the page and choose **Save this chat to AI Organizer** (context menu).
- Supported sites: ChatGPT, Claude, Gemini, Grok, DeepSeek, Perplexity.

Workspaces (folders)

Open the **Folders** tab to create workspaces: name, color, and icon. Edit or reorder from the list. You can set a **default folder per AI platform** in the Dashboard (Saving & backup → Default folder per platform). Chats can be moved into folders from the Saved Chats list (bulk move or drag-and-drop).

Saved Chats tab

- **Search** by chat title or notes.
- **Sort** by date saved, title A–Z, platform, or folder; newest or oldest first.
- **Filters** (Menu → Filters & sort): tag, platform, folder, date range, quick filter.
- **Bulk actions**: select chats, then Move, Delete, or Export.
- Drag chats into the drop zone to move to a folder. Add **notes** to chats via the note action.

- Click a chat to open it in a new tab.

Prompts

In the **Prompts** tab: add prompts with title, category, subcategory, tags, optional note, and content. Use **placeholders** like [product name] in the text; when you paste, you'll be asked to fill them. Filter by category, subcategory, or tag; search; use "↓ Last" to jump to the last prompt. On AI pages, the floating **Prompts** button opens your list so you can paste any prompt (or chain) into the chat.

Prompt chains

In the **Prompt Chain** tab: create a chain (name + ordered list of prompts). "Paste" runs the chain in order and supports placeholders. Edit or delete chains from the list. Availability may depend on your plan.

Import, export, share

- **Export:** download a JSON backup of chats, prompts, folders (footer or Dashboard).
- **Import:** from a JSON file or from a **shared workspace link** (e.g. <https://sync.aiorganizer.biz/s/...>).
- **Share workspace:** get a link or export as Excel, Word, or JSON (from folder/workspace share options).
- **Clear all:** removes all local data (confirm required); export a backup first if needed.

Dashboard (options page)

Open via the "Dashboard" link in the extension. Overview shows counts for chats, prompts, folders, and chains; plan limits; and supported platforms. Quick actions: Export backup, Import backup, **Sync to account**, **Restore from account**, keyboard shortcuts, Clear all. Sections: Saving & backup (floating button style, optional "ask to save" and backup reminder days), default folder per platform, and organize folders/chats/prompts.

Theme and menu

Theme: Light, Dark, or System (header dropdown). **Menu** (☰): recently opened chats, Filters & sort, Dashboard, Logout.

Keyboard shortcut

Save the current chat: Ctrl+Shift+S / Cmd+Shift+S . You can change it in Chrome at <chrome://extensions/shortcuts>.
